Electric Power Exercises Many Functions That Are Peculiarly Its Own

There are certain mechanical plants that can be run by electricity only—for example the big stone quarries around Chicago. They require cars that without anybody aboard will travel over a mile of track, start when wanted, stop when wanted, climb up steep grades with 10 ton loads and run down again without damaging anything. ELECTRICITY alone supplies the way to do this. The operation furnishes a graphic object lesson of

The Flexibility of Electric Power
--the readiness with which it meets any requirement

This fact is of intimate interest to numerous mechanical plants which have developed the need of a change in arrangement, or of an addition to mechanical equipment, or of an improvement in the working of some integral mechanical part; or perhaps that face a requirement to do something that cannot be done by steam except at prohibitive cost for installation and operation.

The proper resort at this stage is to Electric Power

Why? Because it is adaptable to any mechanical situation or kind of machinery; it reduces lost motion—its application is direct; it is compact—you can put a tremendously powerful motor in small space; its control is simple; its efficiency is the highest and its cost is the lowest. And of course we are prepared to demonstrate the truth of all this.

A plant provided with the economic advantages of electric motor drive is like a runner stripped of surplus weight ready for a race.
