

HOME COURSE IN SCIENTIFIC AGRICULTURE

One of a Series of Sixteen Articles by Noted Government and State Experts

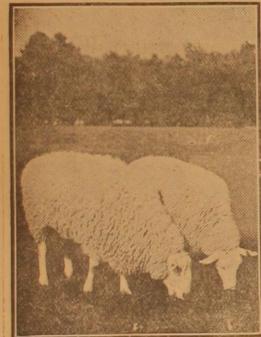

FIRST ARTICLE—SOIL CONSERVATION.

By W. J. SPILLMAN, Agriculturist in Charge of Farm Management, Bureau of Plant Industry, Department of Agriculture.

HOW to restore and maintain the productivity of the soil is the most important phase of the conservation problem. In many of our older communities soil fertility has been reduced below the point of profitable production. Nation wide effort at the present time, through federal and state agency, is directed toward the restoration of fertility in these localities. In the older countries of Europe, where farming has been followed for many centuries, the problem of satisfactory yields of farm crops has been solved. The agriculture of Germany is similar to that of the United States, but the yield per acre of wheat in Germany is more than twice that in the United States. The yield of rye nearly twice as large, the yield of barley nearly a third larger and the yield of oats more than one-third larger.

The proportionate area of cereals grown in Germany is about one-fifth less than in the United States, while the proportionate area of hay and forage crops is one-half greater. In addition to that, the percentage of the total area which is planted to root crops is enormously greater in Germany than in the United States. These root crops consist largely of potatoes and sugar beets, and the best German authorities estimate that at least one-third of the products of the area of these two crops is available for stock feed. They also estimate that one-third of the products of the area devoted to cereals is devoted to the feeding of domestic animals. Germany therefore devotes very much more of her soil to the production of feed for live stock than does the United States.

On the same area of farm land the German farmer maintains on the average from 30 to 78 per cent more live stock than does the American farmer. The manure from these animals is also better cared for in all European countries than it is in this country. Not

"ANIMALS WITH GOLDEN HOOPS"—SHEEP MAKE THE SOIL FERTILE.

only that, the United States exports vast quantities of cottonseed meal, linseed oilmeal and other rich nitrogenous feeding stuffs, while Germany imports vast quantities of these materials. German farmers not only conserve their own natural resources, but they draw on other parts of the world to maintain the fertility of their lands. America has been mining her soil and shipping the products to Europe. In addition to the sources of fertility above given, Germany uses annually on her soil 550,000 tons of nitrate of soda, 275,000 tons of sulphate of ammonia, 1,200,000 tons of superphosphate and 1,400,000 tons of basic slag in addition to large amounts of potash salts.

We are now confronted by the same necessities that compelled the adoption of sound systems of agriculture in the old world. How shall we meet this problem?

The Solution of the Problem.

In the first place, we must increase the number of domestic animals on our farms. Where land is farmed by renters the leases must be made for longer terms, and where the renter has not the capital to provide the proper number of domestic animals these must be supplied by the landowner. The effect of live stock on the fertility of the soil needs no demonstration. It is well known to every intelligent farmer. Up to the present time, at least, no system of agriculture has been permanently profitable without the use of domestic animals as a means of maintaining the productivity of the soil. Whether such systems are possible remains to be seen.

In addition to increasing the number of domestic animals on American farms our farmers must pay more attention to leguminous crops and to other crops which provide a supply of humus for the soil. Legumes, such as clover, peas, alfalfa, etc., are especially important because of the fact that with the aid of certain soil bacteria they are able to draw their supply of nitrogen from the air. Having thus an unlimited supply of this valuable plant food constituent, they become very rich in nitrogen. The stubble and roots of a

leguminous crop frequently leave in the soil sufficient nitrogen for the needs of the crop that follows. Recent investigations by the department of agriculture in Kansas and Nebraska show that the average increase in the yield of corn grown after alfalfa, compared with corn grown after nonleguminous crops, is 75 per cent. A good crop of clover has a similar effect on the yield of crops which follow it. Instances are known where the practice of sowing bur clover in cotton fields in the fall of the year and turning it under in spring in time for another crop of cotton has in three years doubled the yield of cotton. Crimson clover sown in a similar manner between crops of corn has in a few years increased the yield of corn 50 per cent or more.

The reason these leguminous crops have such a marked effect on fertility in many cases on depleted soils lies in the fact that nitrogen is not a constituent of the soil proper, but only of the decaying plant and animal matter in the soil. When soils are farmed for many years without any attention to their fertility this organic matter is rotted out and the nitrogen disappears. Hence nitrogen is nearly always the first plant food constituent to become deficient in the soil.

The fact has already been referred to that we export a large proportion of our cottonseed meal, oilmeal and other rich nitrogenous feeding stuffs. These materials are all exceedingly rich in nitrogen. They should be kept at home, fed to live stock and the manure returned to the land.

Dependence on Our Own Resources. There is this difference between our situation and that of the older countries of Europe: Hitherto we have been exporters of our feedstuffs rich in fertilizer constituents, while they have been importers. They have been drawing on the newly settled regions of the world for materials with which to feed their crops. The American farmer will be making a long step forward when he quits exporting these materials and returns them to his own soil. Whatever shortages there may be must be made up by the intelligent use of commercial fertilizers. There is no danger of a nitrogen famine. We can grow leguminous crops to supply nitrogen. We can also, by judicious use of the refuse from grain and other crops and by the use of intelligently planned crop rotations with occasional catch crops for green manure, keep up an abundant supply of humus. Even if we had no other resources for maintaining the fertility of the soil than leguminous plants and humus making crops we could on much of the land in this country maintain a much higher standard of yields than obtains at the present time.

Examples of Successful Farming.

In New York state there are large areas of land which formerly produced satisfactory crops, but which in recent years have been reduced in fertility to the point where their cultivation is no longer profitable by the methods in vogue in that section. A few years ago a representative of the department of agriculture induced a farmer in that section to grow four acres of potatoes under his direction. This farmer had been growing potatoes for many years, using seed which had been grown for sixty years in that locality without success to maintain its quality. His ordinary yields of potatoes were about forty bushels per acre. He was induced to secure new and improved seed and to cultivate in the most thorough manner. As a result these four acres produced a yield of 250 bushels of potatoes per acre. Similar results have since been secured by a number of other farmers in the same locality.

An Illinois farmer a good many years ago established on his farm a rotation of corn, corn, oats, clover. The corn and oats were fed to hogs, which were allowed to graze on the clover. Very little feed was purchased, but everything raised on the farm was converted into manure and returned to the land. At the beginning of this system of farming the yield of corn was about thirty-five bushels to the acre. Ten years later it had risen to eighty bushels per acre, the average yield for four consecutive years being 80.4 bushels per acre.

A Missouri farm which had been devoted to corn and wheat for seventy years and on which the yields of wheat were about eight bushels per acre and corn about twenty-five bushels was subjected to a system of farming similar to that just described for an Illinois farm. In six years the yields of this farm were more than doubled. In work of this character the following points are emphasized:

Deep fall preparation of the soil. Planting of well selected seed. Mainly shallow and frequent cultivation of the crop during the growing season and especially after a rain. The judicious use of commercial fertilizers and the increased use of home produced fertilizers and the growing of leguminous crops.

Freezing Not Harmful to Fishes. Fishes do not need to maintain a uniform or nearly even bodily temperature, and they can be frozen solid and thawed out months afterwards without injury to their health, if the process is not too sudden. Such changes happen to millions of them every year in the rivers of the colder parts of Siberia.

Prayer for Strength. O Lord, give us all, we beseech thee, grace and strength to overcome every sin; sins of besetment, deliberation, surprise, negligence, omission; sins against thee, ourself, our neighbor; sins great, small, remembered, forgotten—Amen.—Christian G. Rossett.

Modern Advancement. Just the use of common sense, the following of personal choice, so far as that choice is moral and measured by the best instead of the worst of one's self, and the expenditure of a few pennies will place at the disposal of any worker such means of self-education as were not to be had by the rich of a generation ago.

Distinction. Cora was fond of all-inclusive prayers, and one night she offered the following discriminating petition: "Lord, please bless mother and father and all of us, and give us everything good; and please bless our friends, and give them what is good for them!"—Harper's Magazine.

Answered. Girl's Father—Before consenting to your marriage with my daughter, I should like to know what you are worth. Young Man—Well, I get \$10 a week, but I am worth \$50.—Lippincott's Magazine.

Earthly Punishment. The way of the transgressor is well written up.—Kansas City Journal.

Get your job printing done at this office. We can do it satisfactorily.

HEENAN'S STREATOR ILLINOIS

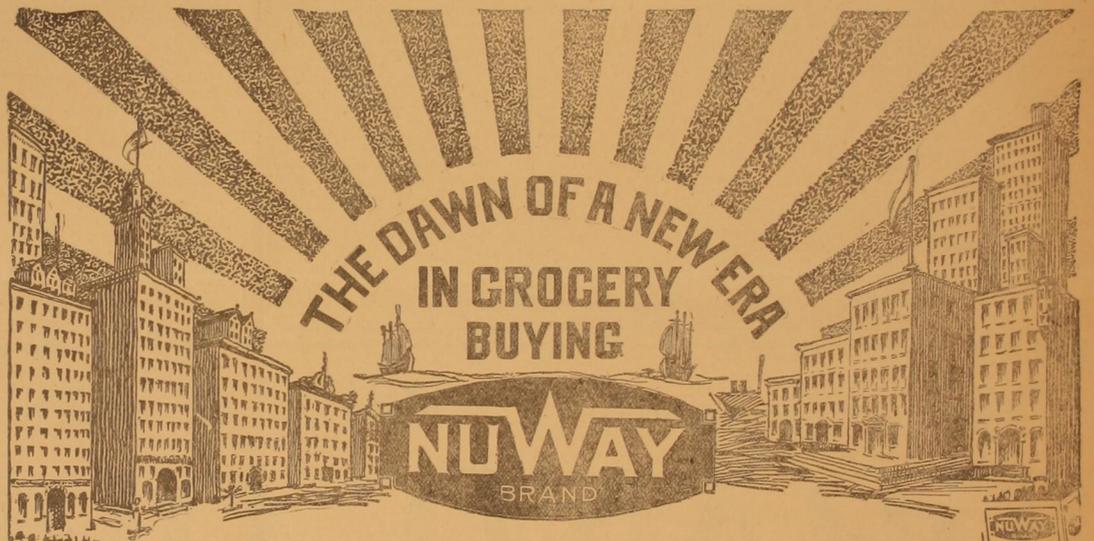

YOU are especially invited to be present at our exhibition of

SPRING APPAREL

For men and women

Thursday, March Thirteenth to Saturday, March Fifteenth

The latest and most authoritative styles will be shown and you are urged to inspect them carefully at your leisure.

Truly, the Dawn of a New Era in Grocery Buying Has Come!

It's the pleasing NUWAY plan. The plan that has taken the country by storm. The plan that cuts down the cost of living and furnishes your entire home FREE. A sensational success everywhere, and adopted by us as the most modern, the most satisfactory and the most unique idea that has ever come before us in our wide experience as grocers. Under the NUWAY brand, there are 219 different products, covering everything used daily in every home in the land. Each individual product is guaranteed by the manufacturers, and by us, to be the very highest quality money can produce.

Thousands of families all over the country have adopted NUWAY. And in every family you hear expressions of delight and praise for NUWAY. As grocers who know the business thoroughly, we candidly tell you that NUWAY is the IDEAL way to supply your daily needs for table and home. Briefly, the NUWAY plan is this: Instead of spending thousands of dollars in advertising on billboards, in street cars, in magazines and other costly ways, as other food products must do, NUWAY puts that advertising appropriation into the quality of its products and into the exquisite premiums with which you can beautify your home FREE.

We ask you not to confuse NUWAY with other premiums, plans, etc., for the NUWAY idea is miles ahead of anything in the world. The premiums given for NUWAY certificates are really beautiful, useful and practical premiums that the richest homes in the land will welcome. The manufacturers of NUWAY goods have issued a complete catalog showing a few of the many beautiful premiums given FREE. We will give you a copy of this new catalog for the asking. This catalog explains in more detail all about the NUWAY plan. It's a very interesting story. Read it, and when you have finished you will understand—

The Three Big Advantages in Buying Nuway Goods

- 1st—We guarantee NUWAY goods to be the finest quality in the world at the price.
- 2d—We guarantee NUWAY products to represent absolutely greater value for your money.
- 3d—NUWAY Premiums of richest taste are given you FREE with NUWAY certificates.

As Grocers of Experience, We Unhesitatingly Recommend NUWAY

NUWAY is spreading over the town like wildfire. Ladies are simply delighted with the supreme NUWAY qualities. All are delighted with the beautiful NUWAY premiums, and we say to you unhesitatingly—AS GROCERS OF EXPERIENCE, WE WOULD NOT RECOMMEND NUWAY AS WE DO UNLESS WE KNEW ABSOLUTELY NUWAY PRODUCTS TO BE THE HIGHEST QUALITY FOR THE PRICE—and we believe we know something about the food product business. We would not risk the loss of our valued patronage by recommending something that wasn't right, so we say to you, TRY NUWAY

and if they do not meet your every expectation in superior quality and weight, and if the exquisite premiums do not please you, we will refund your money instantly without quip or quibble. All NUWAY products are carefully packed in sealed cartons, etc., and are guaranteed not only by us, but under the U. S. Pure Food and Drugs Laws. Save the valuable certificates and secure the beautiful premiums FREE in almost no time. Come in any day this week and let us demonstrate NUWAY goods to you and also explain the NUWAY plan. You will be delighted. You will be amazed. You will be pleased.
